

#### Artefact 1 - ERD:

For Release 1 of this project, I was responsible for creating the database. The ERD for Release 1 reflects the progress of the project. The ERD is a representation and model of how the data is used for the framework of the project.

#### Artefact 2 - MySQL Database (Previous Iteration of Database could not be located):

In Release 1, I created the database as the framework for the project. There are four tables I created: orders, packages, roles and users.

#### Artefact 3 - CSS (Previous Version of Website could not be located):

After a sprint meeting, my team received the peer review from the client team, they addressed their concerns about the appearance of the website as not being modern and professional. I was responsible for styling the existing website. The global changes I made to the website included colour scheme, navigation bar and inserting the brand logo into the header. In terms of individual pages, I was responsible for restyling the Home and Login pages. Other pages were assigned to the remaining members of the frontend team.

#### Artefact 4 - Mobile Responsive:

During Release 1, I also worked on the mobile responsiveness after the restyling of the website. The main purpose of the mobile responsive website was to allow drivers to easily view their orders out in the field.
