Artefact 1 - ERD:

In Release 2 of this project, I continued developing the ERD for the database.
The ERD for Release 2 includes the additional entities for order tracking, payments and order assigning for drivers.

Artefact 2 - MySQL Database:

During Release 2, I was responsible for managing the database for the backend team. From Release 1, I updated the attributes of existing tables to suit the project. For the assigned user stories of each sprint, I created the payments, deliveries and milestones tables.

Artefact 3 - BPM Model:

During the release, the team and I were confused while discussing the correct process of the delivery scenario. As a result, I created a simple BPMN model to show the process of the different milestones a driver reaches.

Artefact 4 - Selenium Testing:

In Release 2 I took ownership of running test cases for the team. Due to unfamiliarity in using Selenium, I was unsure of the correct methods of exporting the test cases. As a result, the task was passed onto another team member. However, three test cases were not used for the final submission of Release 2. The three test cases are login, create staff account and create customer account.
